### **TWO-PIPE HEAT PUMPS**

# Two-pipe inverter air-water heat pumps

The ADATTA heat pump units are ideal for use with radiant panel heating systems or low-temperature applications such as fancoils and air handler units suitably sized for maximum supply temperatures of  $55^{\circ}$ C.

All versions are equipped with extremely quiet EC axial fans and with Twin Rotary inverter compressors which allow complete management of the power of each individual component. The compressor, fan and pumps indeed feature continuous modulation by a control unit programmed with internally developed control logic. It is designed to be extremely intuitive to use, allowing the unit to be installed in a wide range of system configurations.

Switching between the various operating modes (within the same season) is performed automatically via reading of the temperature sensors and by the setpoints. The switching times and logic are designed to ensure maximum system efficiency and reliability. The configuration with production of sanitary DHW with diverter valve requires the installation of an appropriately sized storage cylinder for the high-temperature water. The cylinder must have a well for installation of the DHW operation probe in the upper section, which the unit's controller uses to monitor the need for DHW production.

#### **Technical specifications**

Compact air-water heat pump for outdoor installation with EC axial fan and BLDC Twin Rotary Inverter compressor; modern design with RAL 7016 powder-coated structure. The framework is self-supporting, with removable panels to facilitate inspection and maintenance.

The heat source is the outside air, down to a minimum temperature of -20°C. The limited noise level is ensured by an intelligent control system which regulates the speed of the compressor and fan to meet the actual demand. Moreover, the use of silent blocks for the compressor and the multi-layer sound insulation on the casing allow very low noise levels to be achieved.

The control logic allows the following:

- Regulation of the fan and compressor for particular installation environments
- Electronic control of system supply temperature via climate curve

#### Operation

The heat pumps absorb heat from an outdoor environment and transfer it to an indoor environment, warming it up. Operation of the heat pump in reverse allows the indoor spaces to be cooled during summer.

(refers to 8 kW version) Available sizes (power output): 6, 8, 10, 12, 14, 16 kW

#### Adatta Monoblocco 2T

Available in **6 kW**, **8 kW**, **10 kW**,

**12 kW**, **14 kW** and **16 kW** versions. Two-pipe heat pump with system-side heat exchanger, able to produce hot or cold water to meet the building's heating or cooling requirements, depending on the season, and produce sanitary DHW.

#### **Benefits**

- Electronic expansion valve (suitable for all operating situations)
- Units with modular power output thanks to the inverter technology
- Climate management included with outdoor temperature sensor
- Larger heat-exchange surface

#### Where can it be installed?

- Suitable for new-build construction with high levels of energy efficiency
- Suitable for cold climates and high T production up to 50°
- Ideal where no mains gas supply is possible
- Suitable for applications with radiant systems, fancoils and air handler units

#### **Energy Class**

All versions of Adatta Monoblocco 2T are **energy class A**.

° **DBIASI** 

- 1. EC Fan
- 2. Twin Rotary Compressor
- 3. Finned pack with hydrophilic treatment
- 4. Heat exchanger with larger rows, large heat-exchange surface

#### **Summer operation**

The summer operating modes are:

- **1.** Chiller mode: the unit only produces chilled water for the system
- 2. Heat pump mode for production of sanitary domestic hot water: when there is no cold demand, and on demand from the DHW operation sensor, the unit will heat the water inside the DHW storage cylinder, using the finned pack as the evaporator. The use of hot outside air as the heat source ensures that very high COPs are obtained.

#### **Automatic seasonal regulation**

Switching between modes occurs in a completely automatic manner according to a priority logic for the production of sanitary DHW.

#### k Winter operation

The winter operating modes are:

- Heat pump mode for heating: the unit produces hot water at the system-side heat exchanger for the heating
- 2. Heat pump mode for production of sanitary domestic hot water: high-temperature hot water is produced at the heat exchanger connected to the DHW storage cylinder.
